Comfort and savings are in the details

Rocky Mountain Power ENERGY STAR  
New Homes Program

## Enjoy the benefits of an ENERGY STAR new home

When you're searching for a new home, you have choices beyond neighborhoods and floor plans. You can also choose energy efficient features that make your home more comfortable, environmentally friendly and less expensive to maintain. ENERGY STAR new homes are independently verified to meet the Environmental Protection Agency's (EPA's) strict standards for energy efficiency.

### Taking energy efficiency to the next level

ENERGY STAR new homes achieve high energy efficiency through a variety of reliable and established technologies and building practices.

#### High-performance windows

High-performance windows block out radiant heat in the summer and lose less heat in the winter – resulting in significant energy savings. These high performance windows also have coatings that block harmful ultraviolet rays and help reduce the fading of curtains, furniture and flooring.

#### Heating, ventilation and air conditioning (HVAC)

Improved HVAC systems operate at a higher level of efficiency. This improvement allows for a more efficient system – increasing home comfort.

#### Tight ducts

In typical American homes, ducts leak 20 to 30 percent of the air forced through them. In an ENERGY STAR home, properly sealed duct systems help reduce energy consumption, improve indoor air quality, and substantially improve the efficiency and performance of heating and cooling equipment.

While an ENERGY STAR new home looks the same outside as a conventional home, you'll notice the differences inside:

- energy savings from more efficient systems
- increased comfort with sealed windows and ducts
- decreased energy use protects the environment
- higher resale value
- more buying power with Energy Efficient Mortgages (EEMs)
